Statement

This manual copyright belongs to Zhengzhou Winsen Electronics Technology Co., LTD. Without the written permission, any part of this manual shall not be copied, translated, stored in database or retrieval system, also can't spread through electronic, copying, record ways.

Thanks for purchasing our product. In order to let customers use it better and reduce the faults caused by misuse, please read the manual carefully and operate it correctly in accordance with the instructions. If users disobey the terms or remove, disassemble, change the components inside of the sensor, we shall not be responsible for the loss.

The specific such as color, appearance, sizes &etc, please in kind prevail.

We are devoting ourselves to products development and technical innovation, so we reserve the right to improve the products without notice. Please confirm it is the valid version before using this manual. At the same time, users' comments on optimized using way are welcome.

Please keep the manual properly, in order to get help if you have questions during the usage in the future.

MPn-4C Flammable Gas Sensor

MPn-4C adopts a multi-layer thick film manufacturing process, which integrates a heating electrode, a measuring electrode and a metal oxide semiconductor gas sensitive layer on an Al₂O₃ ceramic substrate, and encapsulates it in a metal housing. When the detected gas is present in the ambient air, the conductivity of the sensor will change, and the higher the concentration of the gas, the higher the conductivity of the sensor. This change in conductivity can be converted into an output signal corresponding to the gas concentration using a simple circuit. The product has good anti-interference ability to common gases such as alcohol and acetic acid in the use scene.

Features:

- *High sensitivity to CH₄ gas
- *Excellent anti-interference ability
- *Excellent stability

Application

It is widely used in combustible gas leak monitoring devices, fire/safety detection systems for home, factory and commercial use; Flammable gas leak alarm, gas leak detector, etc.

Technical Parameters

Model		MPn-4C	
Sensor Type		Flat surfaced	
Standard Encapsulation		Metal cap	
Target Gas		CH ₄ , Nature gas, marsh gas	
Detection range		300~10000ppm (methane, natural gas)	
Standard Circuit Conditions	Loop Voltage	V _c	≤24V DC
	Heater Voltage	V _H	5V±0.1V AC or DC
	Load Resistance	R _L	Adjustable
	Heater consumption	P _H	≤350mW
	Sensitive resistance	R _S	1KΩ ~ 20KΩ (in 5000ppm CH ₄)
	Sensitivity	S	R _S (in air)/R _S (5000ppm CH ₄) ≥ 8
	Concentration Slope	α	≤0.6(R _S 5000ppm/R _S 1000ppm CH ₄)
Standard test conditions	Temp. Humidity	20°C±2°C; 55%±5%RH	
	Standard test circuit	V _c : 5V±0.1V; V _H : 5V±0.1V	
	Preheat time	Not less than 48 hours	
	O ₂ content	21% (not less than 18%) O ₂ concentration effects initial value, sensitivity and repeatability.	
Lifespan		10 years	

Fig1. Sensor structure

Basic circuit

Fig2. Test circuit for MPn-4C

This circuit shows the basic measuring circuit of sensor. Two voltages should be applied to this sensor: heating voltage (V_H) and circuit voltage (V_C). V_H is used for supplying a certain temperature which can be DC or AC. V_{RL} is the voltage on the load resistance (R_L) which connects to the sensor in series. V_C is supply the test voltage for R_L and it must be DC.

Characterization

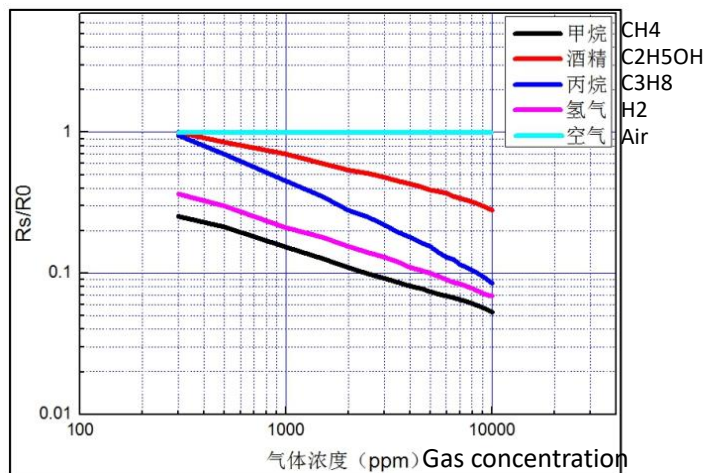

Fig3. Typical Sensitivity Curve

The ordinate is resistance ratio of the sensor (R_s/R_0), the abscissa is concentration of gases. R_s means resistance in target gas, R_0 means resistance of sensor in clean air. All tests are finished under standard test conditions.

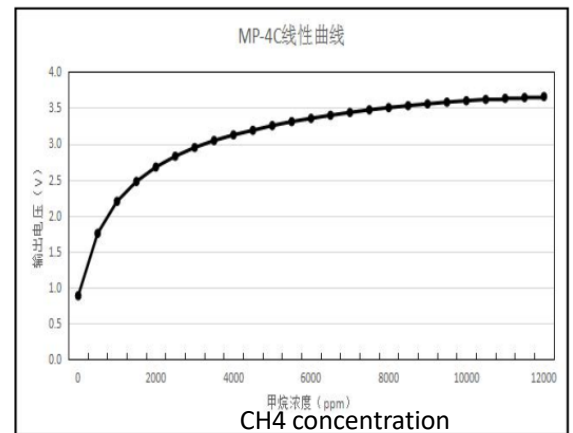

Fig4. Typical temperature/humidity characteristics

The ordinate is resistance ratio of the sensor (R_s/R_0). R_s means resistance of sensor in 5000ppm CH_4 gas, R_0 means resistance of the sensor in air.

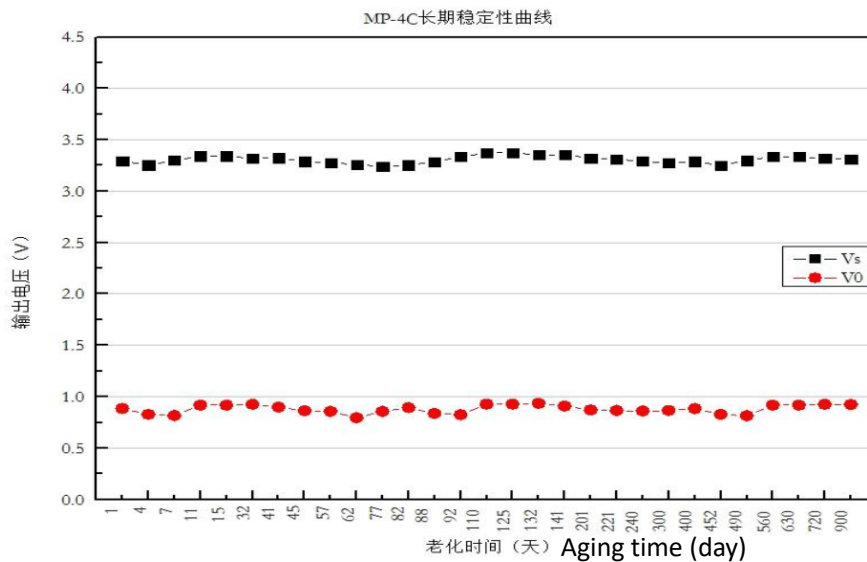

**Fig5. Response and Resume curve**

The ordinate is voltage output of RL which connects to sensor in series. The test is finished under standard test conditions and CH4 concentration is 5000ppm.

**Fig6. Linear curve**

The ordinate is voltage output of RL which connects to sensor in series. The test is finished under standard test conditions,

Long-term Stability

**Fig7. Long-term Stability**

NOTE: All the test is finished in standard test conditions, methane concentration is 5,000ppm. The abscissa is observing time and the ordinate is V_{RL} .

Cautions

1. Following conditions must be prohibited

1.1 High Corrosive gas

If the sensors are exposed to high concentration corrosive gas (such as H_2S , SO_x , Cl_2 , HCl etc.), it will not only result in corrosion of sensors structure, also it cause sincere sensitivity attenuation.

1.2 Alkali, Alkali metals salt, halogen pollution

The sensors performance will be changed badly if sensors be sprayed polluted by alkali metals salt especially brine, or be exposed to halogen such as fluorine.

1.3 Touch water

Sensitivity of the sensors will be reduced when spattered or dipped in water.

1.4 Freezing

Do avoid icing on sensor's surface, otherwise sensing material will be broken and lost sensitivity.

1.5 Applied higher voltage

Applied voltage on sensor should not be higher than stipulated value, even if the sensor is not physically damaged or broken, it causes down-line or heater damaged, and bring on sensors' sensitivity characteristic changed badly.

1.6 Voltage on wrong pins

As Fig8, Pin 1&2 connects to heater circuit, Pin 3&4 connects to measuring circuit; Under the requested conditions, heating and measuring can use the same power circuit.

NOTE: the two pins near the protuberance mark is heating electrode.

Fig8.Pin Schematic Diagram

2 .Following conditions should be avoided

2.1 Water Condensation

Indoor conditions, slight water condensation will influence sensors' performance lightly. However, if water condensation on sensors surface and keep a certain period, sensors' sensitive will be decreased.

2.2 Used in high gas concentration

No matter the sensor is electrified or not, if it is placed in high gas concentration for long time, sensors characteristic will be affected.

2.3 Long time storage

The sensors resistance will drift reversibly if it's stored for long time without electrify, this drift is related with storage conditions. Sensors should be stored in airproof bag without volatile silicon compound. For the sensors with long time storage but no electrify, they need long galvanical aging time for stability before using.

The suggested aging time as follow:

Stable2.

Storage Time	Suggested aging time
Less than one month	No less than 48 hours
1 ~ 6 months	No less than 72 hours
More than six months	No less than 168 hours

2.4 Long time exposed to adverse environment

No matter the sensors electrified or not, if exposed to adverse environment for long time, such as high humidity, high temperature, or high pollution etc., it will influence the sensors' performance badly.

2.5 Vibration

Continual vibration will result in sensors down-lead response then break. In transportation or assembling line, pneumatic screwdriver/ultrasonic welding machine can lead this vibration.

2.6 Concussion

If sensors are strongly impacted or dropped, the lead wire will disconnected.

2.7 Usage Conditions

For sensor, handmade welding is optimal way. The welding conditions as follow:

- Soldering flux: Rosin soldering flux contains least chlorine
- homothermal soldering iron
- Temperature: $\leq 350^{\circ}\text{C}$
- Time: less than 3 seconds

If disobey the above using terms, sensors sensitivity will be reduced.
